

DOCKER CLIENT

ALQAMA SHUJA

The **Docker Client** is a **command-line tool** that allows users to interact with a docker daemon (Docker Server).

With the **Docker Client**, you can manage containers, images, networks, and volumes, as well as automate tasks, such as building and deploying containers.

The **Docker Client** communicates with the **Docker Daemon** (Docker Server) using REST APIs, which are exposed by the docker daemon.
