Docker Daemon

ALQAMA SHUJA

The Docker daemon is the core component of the Docker platform that manages containers, images, networks, and volumes.

It communicates with the Docker client to carry out tasks such as building images, starting containers, and managing networks and volumes.

The Docker daemon runs as a background service on a host operating system, such as Windows, macOS, or Linux.

Docker Daemon listens for API Requests from the Docker client and uses the Docker API to communicate with the Docker client.

Thank You
